EDUCATION

Liberty University
B.S. in Computer Science

Aug. 2022 – May 2027
Lynchburg, VA

PROFESSIONAL EXPERIENCE

Software Engineer, Data Intern

Jun. 2025 – Aug. 2025

Cachengo — Huntingdon, TN (Remote)

- Generated synthetic datasets in Python to stand in for not-yet-available computer-vision event data (person/vehicle/animal detections from security cameras), unblocking the team to build and validate Power BI dashboards months ahead of the upstream data pipeline.
- Built an MCP server integrating AI agents to automate internal data workflows.
- Contributed to the company's Capacitor-based mobile app for end-user security-camera monitoring.

Freelance Web Developer

2025 – Present

Contract — Sweat & Soak, Brewvita Coffee Co.

- Built sweatandsoak.com for a college wellness-event company covered by The New York Times and Fox News (Vite, Cloudflare), and rebuilt brewvita.com for a student-run coffee shop, replacing a hosted site builder with a custom front end while keeping Square as the payment backend.

Senior Capstone Developer — Salesforce Platform

Aug. 2026 – May 2027

Upsource Solutions (Salesforce ISV) — Lynchburg, VA (in progress)

- One of five seniors building internal developer tooling for a Salesforce consultancy and AppExchange ISV, targeting their two products: MergeUp (Salesforce document generation) and sFiles (SharePoint–Salesforce file integration).
- Scope: a Bash entry point that provisions a working scratch org from clean prerequisites via SFDX — package resolution, shared metadata, reusable deployment logic and synthetic seed data — so a full demo environment builds in one command instead of by hand.
- Engineering guardrails: automated tests, linting, static validation and GitHub Actions CI, with shared logic centralized across four independent industry modules.

PROJECTS

Botflow — AI App Builder

Jul. 2025 – Present

Founder & Sole Developer (SaaS, LLC)

- Sole developer of a production SaaS that turns natural-language prompts into deployed apps — Vite web apps and native Swift iOS apps — with live users, tiered plans, and metered billing (92K lines).
- Built the native iOS pipeline end to end: compiles prompt-generated Swift on a Mac build cloud, streams a live H.264 Simulator preview to the browser, produces App Store builds, and sideloads onto users' plugged-in iPhones through an Xcode-less Python installer.
- Hardened the platform's two untrusted-code surfaces against RCE: a self-hosted Firecracker/KVM microVM sandbox (Go) running agent-generated code, and the Mac cloud compiling user-authored Swift.
- Fronted six LLM providers behind one gateway with per-provider token metering, and built a usage-metering and credit-billing system reconciled in Postgres.
- Built the monetization stack: Stripe Connect payouts to app creators and RevenueCat iOS subscriptions, with automated per-tenant backend provisioning (Convex + Cloudflare Pages).
- Evolved from an earlier appointment-booking chatbot SaaS (2023–2025) I led as a 4-person capstone team, landing 3 launch customers and a \$1,000 university pitch win before pivoting and open-sourcing it.

Personal Website & Blog

May 2025 – Present

- Built awkohler.dev in Next.js and Tailwind, with a full-stack blog on a Spring Boot REST API (JPA) backed by Oracle Cloud, serving sub-100ms load times.

TECHNICAL SKILLS

Languages: TypeScript/JavaScript, Python, Go, Java, C++, SQL

Frameworks & Libraries: React, Next.js, Vite, Node.js, Tailwind CSS, Spring Boot, Convex, Drizzle ORM, Pandas, NumPy

Infrastructure & Tools: PostgreSQL, Redis, Docker, Cloudflare, Vercel, Fly.io, GitHub Actions, Stripe, OpenAI & Anthropic APIs
